## Conclusion

.Streaming is a technology for delivering audio and video content across a network without waiting for the entire file to download.

.Helix from RealNetworks is a universal digital media delivery platform. Because it is a universal server, it can offer native delivery of RealMedia, Windows Media, QuickTime, and the different MPEG files (1, 2, 3, and 4) over the Internet.

.RealProducer is the best option for creating RealMedia files, because it is able to encode videos using the latest encoder. This encoder allows for highly compressed video for small file sizes, but still retains very high video and audio quality.
